

What is ICT?

ICT stands for **Information Communication Technology**. The term can be used to describe any advanced technology that is used to communicate information. Most students think that ICT requires that something is being done on a computer or on the Internet. While

this can be true, ICT is not exclusive to computers or the Internet.

The focus of ICT is not only using technology to create products such as print documents, photos, web pages, media graphics, and video recordings, but also to analyze the information and to make meaning of what is being communicated.

In the first assignment you will be challenged to find examples of ICT in your own life.

Take some time to explore this idea. In what ways do you communicate using technology?
